## Guided reading strategies for 2nd grade

Page 2Hop to help your fifth grader with math skills? Here are some basic tips that experts are suggesting for fifth gradth students. As mathematics becomes more complex as they are learning and less clearly associated with their everyday experience, some children begin to develop math anxiety. It's important to keep your child engaged with math and to help him understand the real-life applications of the concepts he's learning at school. Coming up with a budget for back-to-school supplies or for monthly allowances is a way for them to practice additional and subtraction. Asking them to help with cooking or baking shows them how fractions work. It's also good practice to help you calculate prices when you're doing grocery shopping. Help your child reduce stress on mathematics by familiarizing yourself with the concepts that are covered in the classroom. Ask your teacher for a course and refer to this to preview each evening's content that will be covered in the math class of the next day. Skim with them on these pages. There is no need to spend time working on the meaning of concepts or trying sample problems, although you can consult terminology for definitions of unfamiliar words. Even this slight increase in the faceness with the conditions that come the next day will help your child approach mathematics with more confidence. If your child is struggling with math problems, they should read each problem slowly and carefully so that your child can hear the problem and think about what is being asked. This helps them to break the problem and come up with problem solving strategies. Talk positively about grades or abilities instead of math and reward effort. Think about how important reading and how we are told to model this behavior for our children. We need to place math in the same category. Don't discount the importance of mathematics by saying, I am not a person of mathematics, I was never good at mathematics. Help your child read books involving math by David Schwartz, such as millions of cats by Wanda Gag, or OnBeyond A Million: An Amazing Math Journey, by David Schwartz to familiarize yourself with the range of online resources that can help your 5th grader practice and review the math concepts they're learning. Connect work with decimals that your child is doing in class for the real world by encouraging them to shop for bargains. Divide the cost of bulk packaged items by the number of single items to find them cost per item. So how much can you pay per roll of paper towel or per soda when you buy in bulk? Or ask them to calculate how much you'll save per item with sales prices offering volume discounts. Help your family familiarize themselves with fractions by asking for recipes on their scale to their fifth grader. Half of them or a recipe Let's start with. When they feel comfortable doing so, ask them to convert to 11/2, a recipe that is supposed to feed a family of four to work for a family of six. How to Master Math: FractionJune 4, 4, A bank account up for your child. Before doing so, discuss with them the basic concepts of banking- interest, checking and savings accounts, credit and debit cards, etc. The experience will help them get excited about saving and increasing their money. The games start with basic additions, providing a fun and engaging way of exploring a host of mathematical concepts. Any hard-core baseball fan knows that the game can't really be appreciated without an understanding of some essential stats, like a player's batting average and batted in runs. If your child is passionate about a game, encourage them to explore it through mathematics. Play family games that help boost math skills. These include card games like Go Fish, which require card counting and sorting in sets, or Monopoly.To board games to find out what your fifth grader will be learning in math class, check out our fifth grade math skills page. Today's parenting guide resources were developed by NBC News Learn with the help of subject matter experts, including Joyce Epstein, director, school, family and community partnerships, center on Johns Hopkins University; Pamela Mason, Program Director/Lecturer on Education, Harvard Graduate School of Education; Dennis Walston, director of mathematics, Council of Great City Schools; Nel Duke, Professor, University of Michigan; Leanna Baker, retired math teacher; Bon Crowder, math teacher and blogger, MathFour.com; and Robin Schwartz, VP, NYC's Union of Mathematics Teachers, and Common Core align with state standards. Page 2Hopping to help your second grader with math skills? Here are some basic tips that experts suggest. Helping your second grader with math means help him understand the meaning of math concepts, not just the processes of committing a written problem. Making math as hands on as possible is the best way to ensure that they develop an understanding of concepts and number sense. To help your child really understand the math they need to master, keep learning simple, use real tools and everyday objects, and make it fun. Just call your learning activity a game and you can guarantee that you'll have your second grader's attention! Talk positively about grades or abilities instead of math and reward effort. Think about how important reading and how we are told to model this behavior for our children. We need to place math in the same category. Don't discount the importance of mathematics by saying, I am not a person of mathematics, I was never good at mathematics. Help your child read books that involve math, such as millions of cats, by Wanda Gag, or on a million: an Amazing Ath Journey, by David Schwartz.To help your child make a number sense, count a specific number to pick him up with many small items (beans, money, etc.) and start with a small number. Then take your hand (or a cup or a small bowl) and some objects. Cover quickly. Ask: How many are in my hand? They should be able to figure it out Which are left. So if there are five objects and you cover three, they should look at the two remaining objects and determine that three are covered. Do a variety of different combinations of covered objects using the same number of objects. Then try it with more items, up to 20. Your child will get practice by looking at the extra and subtraction relationships between the numbers. Your child is starting to use unit fractions like 1/8, 1/4 and 1/2 in the second grade. Cutting sandwiches, fruits, or pastries into equal pieces and counting partial portions is a way to strengthen fraction recognition. Children become so accustomed to seeing adults pay with credit and debit cards that counting actual money can be an unfamiliar practice. Buy things at the store include your child in transactions, allowing him to pay with cash and count changes. This will not only help with their math skills, but will boost understanding of the concepts of savings and spending. Time to practice telling, your child has to draw an analog clock and a digital clock and put the same time on both. You want to help your second grader count time in the five-minute increment. Give him a specific time on a watch and ask questions such as What time was it two hours ago? What time will it be in half an hour? Take a look at a calendar. Ask them questions about the days and dates, like what is the fifth day of the month? How many Tuesdays are there in the month? What is the third Friday date of this month? When cooking or cooking, think about the time required for your recipe. Ask your child to help you find out if it takes about 45 minutes to bake a meat and vegetables you will have to take 30 minutes to be with it to cook, how many more or less minutes than meat loaf vegetables needed? Which do you need to start cooking first? You can build indexing skills by asking your child to try to name their classmates in order to sit in their class. Or outline the steps required to make him a special dish or meal. Your child can also put mathematics information in a pattern. Your child can learn name shapes with an increasing number of sides in order by arranging sticks in a triangle, square, pentagon, hexagon, etc. and telling their names as their child points to them. Since children are most familiar with fraction 1/2, as, can I have half a glass of milk?. The unit has a strong base from which to start exploring fractions. Compare half a glass of water to an entire glass, half the cookie for a whole cookie, half the book (opening it in the middle) for an entire book. Encourage your child to show you when your child sees or hears the fractions used in daily life. Lots of family games involve math. Tic-Tac-Tow, Connect Four, and Domino's are just some of the many games that help create strategic thinking and math skills. To find out what your second grader will be learning in math class, our second grader math Check the page.
